# Cequence Unified API Protection for Telecom

## Protecting global telecommunications organizations against application & API attacks

As a pioneering early adopter of technology, the telecommunications industry was among the first to embrace APIs and microservices to further business goals, like reducing cost and transaction friction, increasing visibility, and providing customers with compelling new services. Today, internal carrier services like billing, account management, and payments, along with external integration with third-party service providers like Apple, Netflix, Hulu, etc. all depend on APIs. To ensure uninterrupted business success, security teams must prevent the misuse and abuse of these business-critical services.

### API Security Challenges

Today's security teams face numerous challenges when it comes to protecting critical APIs and applications from cyber attacks.

#### Lift the Fog

First, APIs are routinely developed and deployed by disparate teams at lightning speed across a mix of on-premises and cloud infrastructure, creating a “fog of war” that shrouds security team visibility. Discoverable by attackers, these unmanaged and unprotected APIs often contain critical vulnerabilities that can lead to exploited applications and data breaches.

#### Maintain Good Posture

Second, security and development teams do not have a clear and consistent picture of the security posture of their APIs across their application portfolio. Understanding where a critical vulnerability, sensitive data exposure, or business logic flaw can be exploited empowers security teams to work with development teams to remediate pinpointed areas of security risk.

#### Protect the Core

Third, API applications are constantly probed by attackers seeking any opportunity to exploit an application and compromise your organization. The ability to detect and block attacks as they occur can prevent organizations from experiencing fraud, data exfiltration, and business disruption.

### Security leaders are now asking fundamental questions:

1. How many APIs do I have and where are they?
2. What risks do my APIs pose?
3. Can I protect *all* of my APIs and applications?
4. Are my applications and APIs under attack?

Answering these questions is critical to a robust security program, a task made more difficult due to the nature of business. New product launches, organic growth, and acquisitions all require a solution capable of keeping up with this constant change.

### Telecommunications Use Cases

**Mitigate SIM Swaps**

**Reduce CPNI Leakage**

**Protect Hype Sales**

**Prevent Account Takeover (ATO)**

**Prevent Device Activation Fraud**

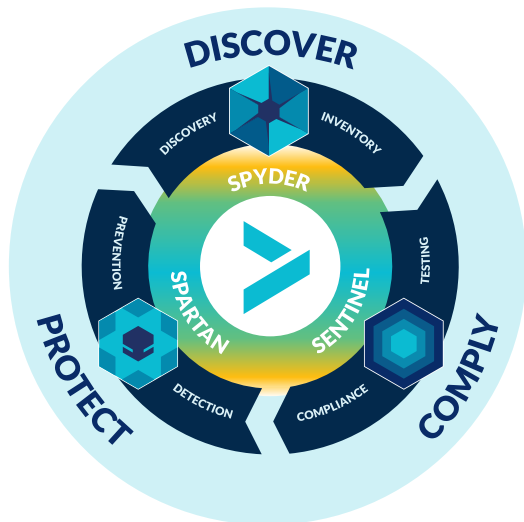

**Prevent Device Port-In Fraud**

# The Cequence Unified API Protection Platform

To address these security challenges, the ideal solution must continuously engage in complete discovery of your entire API attack surface that includes both external and internal APIs, understand your API risk posture pinpointing which critical security vulnerabilities need remediation, and provide real-time protection that detects and blocks attacks *before* they reach your applications.

The Cequence solution is the only security offering that addresses all phases of your API protection lifecycle, discovers your entire API attack surface, eliminates unknown and unmitigated API security risks, and protects your applications and APIs from cyber attacks that lead to data loss, fraud, and business disruption.

## DISCOVER with **API SPYDER** API Attack Surface Discovery

**Discover and classify | Manage external exposure | Alert and monitor changes**

An API attack surface discovery management product that provides visibility of publicly-accessible APIs and their vulnerabilities, giving you an attacker's view of your organization. API Spyder continuously reveals new API servers, endpoints, and hosting providers so that security and compliance teams are aware of their existence.

## COMPLY with **API SENTINEL** API Security Posture Management

**Monitor posture continuously | Test pre-production APIs | Remediate risks**

An API security posture management solution that discovers an organization's complete API footprint, ensures APIs are compliant, conforming to specifications, security test requirements, and governance best practices, and provides autonomous API test creation to identify vulnerabilities and prevent data leakage before production.

## PROTECT with **API SPARTAN** Bot Management & Fraud Prevention

**Block Application & API attacks | Prevent theft, business logic abuse, fraud**

A bot management and fraud prevention solution that protects organizations and their applications from the full range of automated attacks. Requiring no agents, JavaScript, or SDKs, it utilizes multi-dimensional behavioral fingerprints to identify and natively block attacks in real time. It mitigates business logic attacks, exploits, automated bot activity, online fraud, OWASP API Security Top 10 attacks, and much more.

The Cequence Unified API Protection platform enables customers to continuously reap the competitive and business advantages of secure applications and ubiquitous API connectivity. The Cequence solution results in attack futility, failure, and fatigue for even the most relentless of attackers. It significantly improves visibility and protection while reducing cost, minimizing fraud, data loss, non-compliance, and business disruption. ## Protecting Top Global Telecommunication Brands

**\$10T** Business value protected

**8B** Daily API transactions secured

**3B** User accounts safeguarded
